

BPS® Connect

The application for perfectly integrated cash process management

Giesecke & Devrient
Creating Confidence.

Unparalleled flexibility and efficiency in cash center management

Giesecke & Devrient (G&D), a globally leading provider of premium product and system solutions for banknote processing, offers cutting-edge technologies for secure and

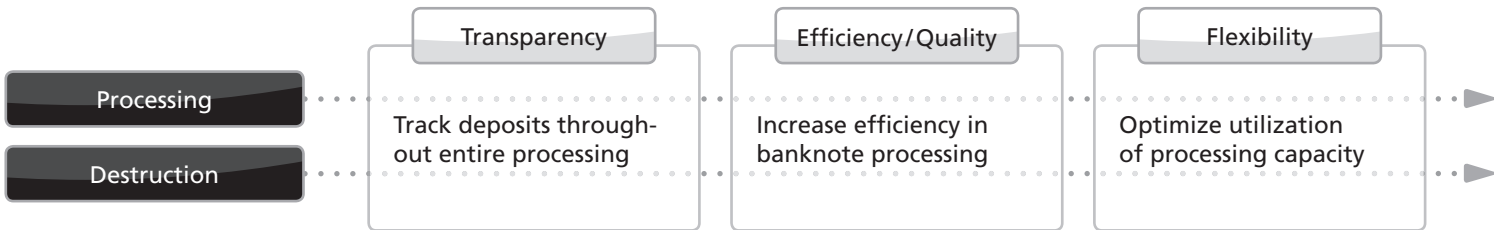

efficient banknote processing, sorting, and verification.

With G&D's fully integrated BPS Connect software solution, you can maximize performance

by seamlessly embedding any vendor's systems in the cash center management process. BPS Connect can, for example, integrate coin processing systems, check scanners, and

peripherals such as printers, RFID readers, or barcode scanners in all imaginable process configurations.

Objective: Process support and flexibility

Benefits of BPS Connect

Optimal process support

- Counting and balancing: Support for all processing activities (tailored to the deposits sent in for processing) and individual customer requirements
- Stock management: Administration of a central warehouse, including inventory management
- On-line and off-line banknote destruction

Multi-system reporting

- Dashboard functionality: immediate visualization of performance indicators
- Customer-specific reporting: flexible, extensible reports
- Central, consolidated reporting: all reports on system availability, performance, etc. are grouped together on a server and consolidated into one multisystem report

Microsoft standard infrastructure: A technology advantage

- Supports Windows®, the Windows® server, and the MSSQL server database for exceptional desktop performance
- Minimal hardware investment since no large extra servers are needed

BPS Connect supports all processes and enables effective process combinations

With BPS Connect, you have unmatched flexibility when combining different systems and processes:

- Two-step process
- FDP process
- Header card process
- One-step process with balancing performed at the machine

Since G&D's banknote processing systems are designed to be used in various process configurations, it is easy to smoothly integrate pre- and post-processing, too. Flexible reporting assures transparency. In short, you have everything you need to harness the full power of your banknote processing systems.

Only BPS Connect can, for example, seamlessly capture all system data – including event reports, banknote rejects, banknote fitness, and system performance – and present it in a transparent, customer-specific fashion at the cash center and headquarters.

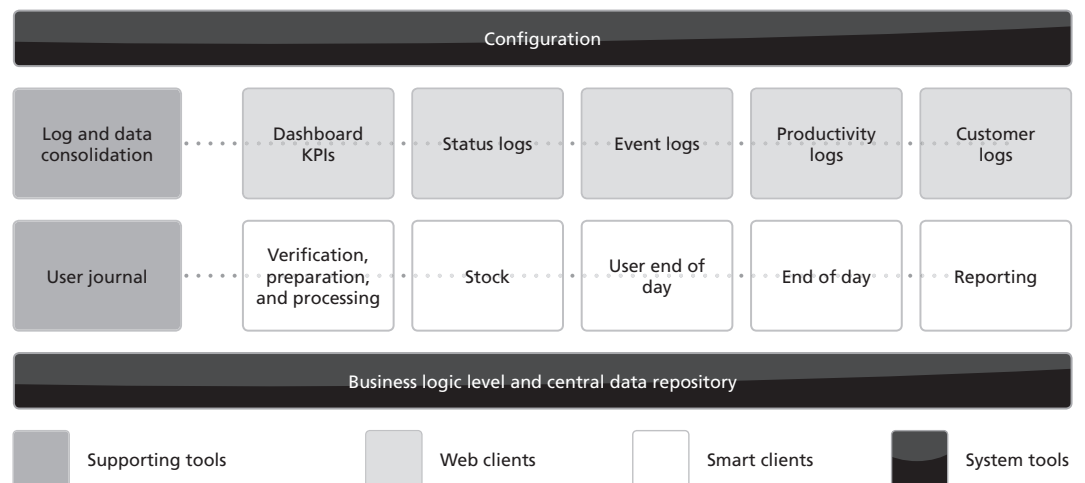

Modular design for custom solutions

One of the strengths of BPS Connect is its highly modular design, which makes it extremely customizable for each user group's needs.

New functions and requirements can be readily integrated without affecting the quality or stability of existing modules. This ensures maximum scalability.

Your benefits at a glance:

- Flexible adjustment of software architecture to your unique requirements
- System operation can be optimized for specific user groups
- Guaranteed quality and performance
- Minimal risk and a reduction in expensive, time-consuming testing since replacing one module does not affect other modules
